# Education and place of death. Inequalities in the prevalence of deaths at home of patients with cancer

Patricia Barber, Ph.D.

Jaime Pinilla, Ph.D.

Beatriz Lopez-Valcarcel, Ph.D.

University of Las Palmas de Gran Canaria, Spain

Health Economists *obsessed* with the quality of life (QALYs), but **what about the quality of death?**

## *Crónica de una muerte anunciada*

Generally, death by **cancer** is **foreseeable**

Many patients (Portugal 50%-Netherlands, 83%) with cancer and their families would prefer death at home with appropriate palliative supporting care (in Spain, 66%)(1)

Home deaths are associated with better symptom control, death preparation, and overall quality of death(2)

But most of persons with cancer die in hospital (76% in Spain)

# Why?

(1) Gomes, B., et al., *Preferences for place of death if faced with advanced cancer: a population survey in England, Flanders, Germany, Italy, the Netherlands, Portugal and Spain*. *Annals of Oncology*, 2012: p. mdr602.

(2) Hales, S., et al., *The quality of dying and death in cancer and its relationship to palliative care and place of death*. *Journal of pain and symptom management*, 2014. 48(5): p. 839-851.

## Why? (hypothesis and evidence from other studies)

England: death at home (1985-1994) small significant association with **social deprivation** indexes in electoral wards (24% in high deprivation vs 30% in low deprivation)(1)

US: The use of **chemotherapy** in **terminally ill cancer patients** in the last months of life was associated with an increased risk of undergoing cardiopulmonary resuscitation, mechanical ventilation or both and of dying in an intensive care unit(2)

6 EUR countries: Better chances of dying at home are associated with **solid cancers**, being **married**, higher **educational** attainment (in Belgium, Italy, and Norway), living in less **urbanized areas** (except in England).(3)

(1) Higginson, I.J., et al., Do social factors affect where patients die: an analysis of 10 years of cancer deaths in England. Journal of Public Health, 1999. 21(1): p. 22-28

(2) Wright, A.A., et al., Associations between palliative chemotherapy and adult cancer patients' end of life care and place of death: prospective cohort study. 2014

(3) Cohen, J., et al., Which patients with cancer die at home? A study of six European countries using death certificate data. Journal of Clinical Oncology, 2010. 28(13): p. 2267-2273.

# Objectives

- 1) to estimate the inequalities in the probability of dying of cancer at home by **education** level
- 2) to analyze the **municipal inequalities** in the probability of dying of cancer at home, and to explore the possible causes of this variability, in particular the **quality of palliative home care**

# Databases

## Main database

Raw micro data of the mortality **registry** of Spain (National Institute of Statistics) for 2014, based in death certificates. Population: **110,278 deaths** with cancer as cause of death (CIE10).

The database has information on municipality of residence for the **774 municipalities** with more than 10.000 population, (**n=83,523**)

## Complementary matched databases (municipal level)

Official sources containing economic and healthcare indicators at municipal level

- Income tax database (anonimized microdata)

- Municipal budgets

- Social Security database

- Registry of the Palliative resources in Spain

# Variables

## Individual characteristics

age

education

nationality

detailed cause of death (CIE10)

place of death

date of death

## Municipal

A long list of economic measures (incomes, taxes, occupation by economic sectors) and demographic indicators (population size, age-sex distribution)

Access to home palliative care provided by a specialized unit accredited by the scientific society of Palliative Care of Spain (google maps+R software)

Listado de recursos que han cumplido los requisitos para ser clasificados con los criterios definidos por el Directorio SECPAL 2015:

# Population of the study and % of home deaths [Spain, 2014]

395,830 deaths

110,278 **cancer** deaths  
(27.86%)

26,755 cancer deaths  
**unknown municipality**  
of residence  
(<10,000 population)

83,523 cancer deaths  
with **identified**  
**municipality** of  
residence

18,271 die  
at home  
(68.3%)

8,484 die  
at home  
(**31.7%**)

62,803 die  
at home  
(75.2%)

20,720 die  
at home  
(**24.8%**)

## Two steps

### **1. Multilevel Linear Probability Model for the probability to die at home**

Level 1: person

Level 2: municipality

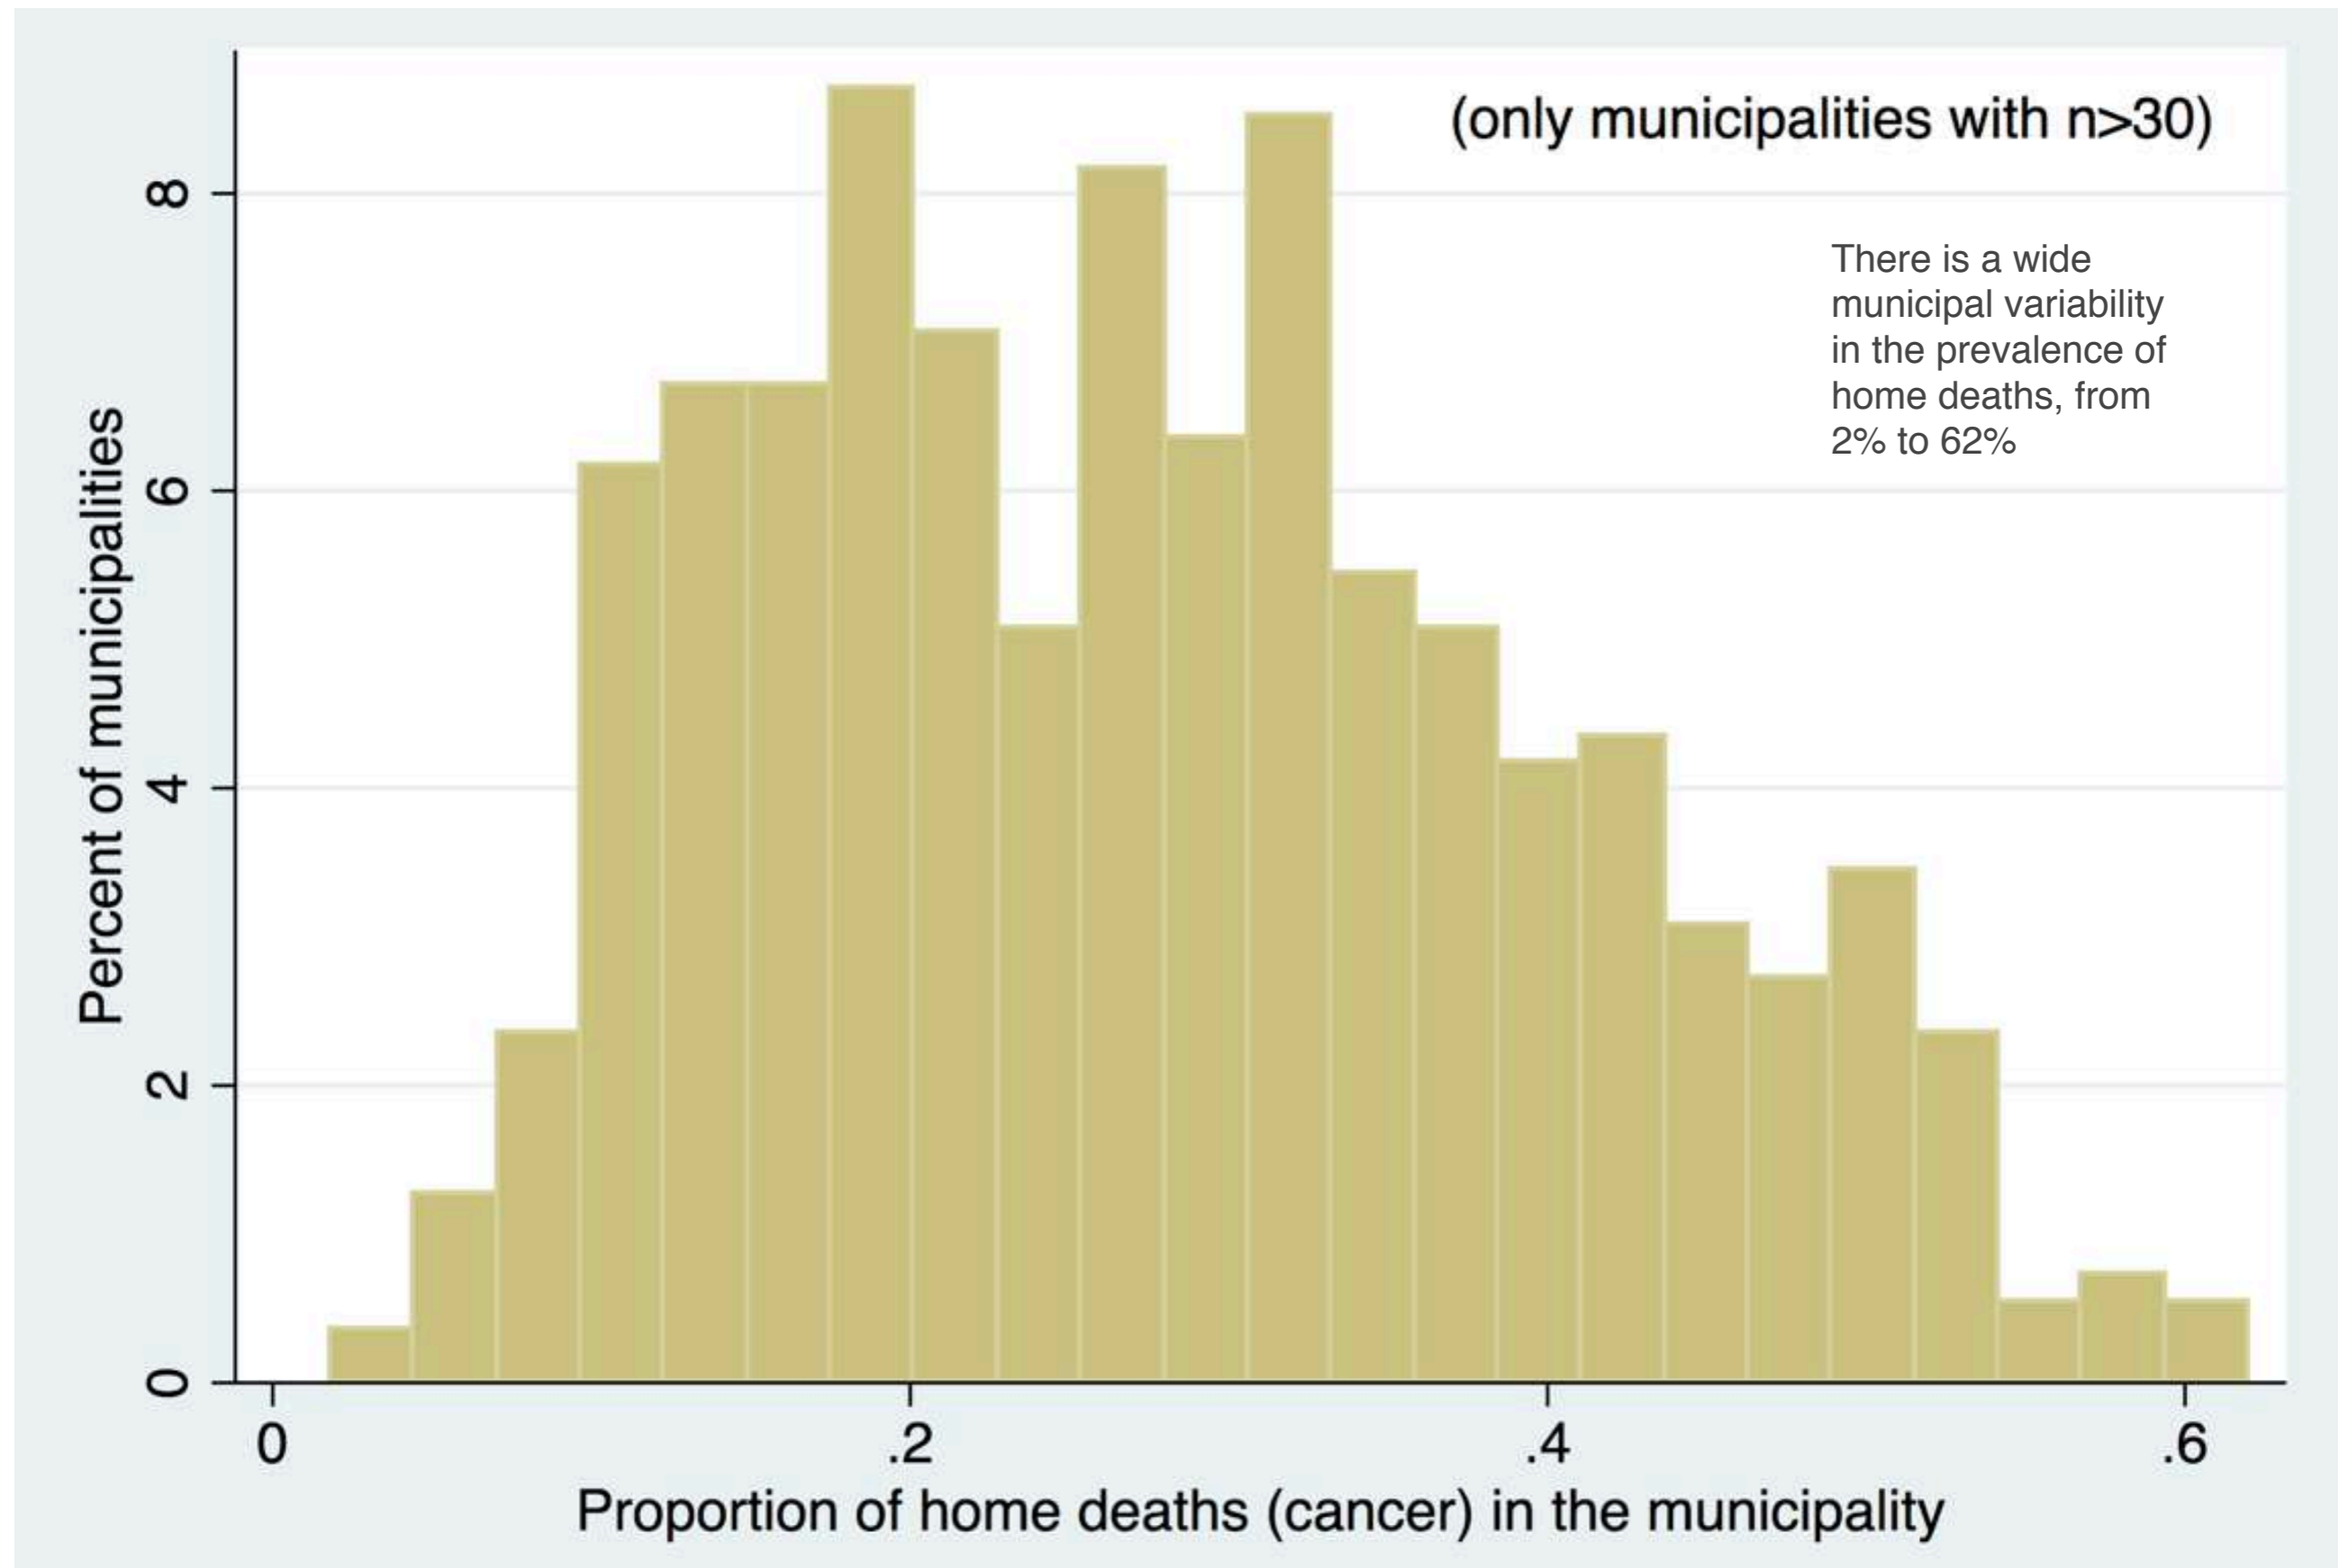

Variable of interest: education

[Keep fixed effects for the 770 municipalities]

### **2. Linear regressions and statistical tests on the fixed effects obtained in step 1**

Focus on access to home specialized palliative care.

Control for demographic and economic indicators

## Step 1

Mixed-effects ML regression  
Group variable: **mun\_re**

Number of obs = 83523  
Number of groups = 752  
  
Obs per group: min = 6  
                  avg = 111.1  
                  max = 7663

Log likelihood = -45873.324

Wald chi2(8) = 1912.18  
Prob > chi2 = 0.0000

Lacking access to home palliative care at one hour of travel time reduces the prob. to die at home

## Step 2

Hospital death is an urban phenomenon. Larger cities exhibit smaller probabilities to die at home and % of agriculture affiliates to social security is positive and significant

Lacking access to home palliative care at one hour of travel time reduces the prob. to die at home

Source	SS	df	MS	Number of obs =	749

The quality of the death shows a significant social gradient in Spain as in other EUR countries (Belgium, Italy, Norway)

There is also high geographical variability

Developing specific plans for palliative care with active role of primary care teams may contribute to improve the situation
